When these undulations reach and act on the nerves of our retina, they produce in us the sensation of light. The only other theory of light which can be opposed to this, and which is variously called the corpuscular, emission, or material particles, emitted from the source, and projected in straight lines in all directions with a velocity which continues with a velocity which continues source, and projected in straight lines in an directions with a velocity which continues uniform at all distances, and is the same for all intensities. It would seem that every phenomenon which can be brought under the corpuscular theory can with equal facility be explained by the undulatory theory; while there are some known effects, as the while there are some known effects, as the phenomena of reflection and refraction, in strict accordance with the principles of the latter, which cannot, without great difficulty and the introduction of gratuitous suppositions, be accounted for by the corpuscular theory. The undulatory theory is therefore now generally adopted by physicists.

The national flag

Union Flag of Britain.

The national flag ⁹¹
of England was the banner of St. George (heraldically described as argent, a cross gules), and soon after the union of the crowns this was united with the Scottish national flag or banner of St. Andrew (in the language of heraldry azure, a saltire argent), thus forming the first union flag. On the legislative union with Scotland in 1707 a new design for the national or union flag was adopted, described in heraldic terms as azure, a saltire argent surmounted by a cross gules fimbricated or edged of the second. On the union with Ireland the red cross or saltire of St. Patrick was introduced, and as guies imbricated or edged of the second. On the union with Ireland the red cross or saltire of St. Patrick was introduced, and as thus modified the flag now exists. The union flag, when used by itself or as an independent flag, is the national banner always used on shore. When it occupies the upper corner or canton next the staff of a red, white, or blue field, the flag so formed is called the red, white, or blue ensign, and in this form it is only used on board ship. (See JACK.) The union of the United States is a blue field with white stars, the stars denoting the union of the States and properly being equal in number to the states. The name seems also to be given to a corresponding portion of any flag.—6. the Gasteropoda, as land-snails, sea-snails, whelks, limpets, &c. The majority of univalve shells are cone-shaped and spiral. In the simplest form the conical shape is retained without any alteration, as in the limtained without any alteration, as in the lim-pet. In most cases, however, the cone is elongated, sometimes forming a simple tube, as in Dentalium, but usually coiled up-into a spiral. Sometimes, as in Vermetus, the coils or 'whorls' of the shell are hardly in contact, but most commonly they are so amalgamated that the inner side of each convolution is formed by the pre-existing whorl. In some cases, as in the common fresh-water Planorbis, the whorls are coiled round a central axis in the same plane, and round a central axis in the same plane, and the shell is said to be discoidal. In most cases, however, the whorls are wound round an axis obliquely, a true spiral being formed, and the shell becoming turreted, trochoid. turbinated, &c.

2. In philos. a general notion or idea; that which by its nature is fit to be predicated of many; that which by its nature has a fitness or capacity to be in many. Universals have been divided into metaphysical, or those archetypal forms existing in the divine mind and forming the patterns after which all things were created; physical, or certain common natures diffused over or shored in by many as ratioality by or certain common natures diffused over or shared in by many, as rationality by all men; and logical, or general notions framed by the human intellect, and predicated of many things, on the ground of their possessing common properties, as animal, which may be predicated of man, llon, horse, &c. In anc. philos. the universals were called predicables, and were arranged in five classes, genus, species, differentia, proprium, and accidens.

The same colour being observed to-day in chalk or snow which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind, and having given it the name of whiteness, it by that sound signifies the same quality wheresoever to be imagined or met with, and thus uncersals, whether ideas or terms, are made.

-World, Universe, Creation. World properly signifies this globe and everything inhabiting it, as animals and vegetables, or immediately associated with it, as the atmosphere, &c. Universe designates the entire mass of worlds, with everything associated with the approximation of the control with them, comprehending all stars, planets, satellites, comets, &c., regarded as one system. Creation, in its most extended sense, is nearly synonymous with universe, differing is nearly synonymous with universe, differing from it principally in not comprehending the Great First Cause and the idea of space. It is often used in a sense limited by the epithet or qualifying word preceding it; as, the brute creation, the rational creation. University (u-in-versitas, the whole of anything as contrasted with its parts the universe later on associa-

with its parts, the universe; later, an associa-tion, corporation, company, &c.] 1.† The whole; the universe. 'Speaking with respect to the university of things.' Barrow. -2 † A corporation; aguild -3. In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important branches of science and literature, and having the power of conferring certain honorary dignities, termed de-grees, in several faculties, as arts, medicine, law, and theology. In most cases the corpo-rations constituting universities include a body of teachers or professors for giving in-struction to students; but this is not essenstruction to students; but this is not essential to a university, the staff of London University being merely an examining body. In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either by faculty or by country (hence the 'nations' into which the students were classed), or both together, its meaning being determined by the words with which it was connected. At a later period the expression universitas literarum (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be important branches of knowledge were to be taught in these establishments; and it would seem that the twofold application of uniseem that the twofold application of universitas led to the distinctive meaning of the term as now used. Some, forming their notion of the word university merely from the English universities, suppose that it necessarily means a collection and union of colleges, that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear versities there are no foundations which bear any resemblance to the English colleges. any resemblance to the English colleges. Besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Bologna and Paris, and these formed models on which many other universities that subsequently express on in

Peliglot first isolated uranium in a pure form in 1840, and determined its atomic weight, at the same time showing that Klaproth's uranium was a protoxide (UO). It was not uranium was a protoxide (UO). It was not obtained compact till 1895. The chief source of uranium is pitchblende, which contains nearly 80 per cent of the black oxide and uranite. Metallic uranium is obtained by decomposing its protochloride with potassium or sodium, first in the form of a black powder, or sometimes aggregated on the sides of a crucible in small plates, having a silvery lustre and a certain degree of malleability. By subjecting the metal in either of these forms to further processes it is ultimately obtained in fused globules. In its compact state uranium is somewhat malleable and hard, but is scratched by steel. Its able and hard, but is scratched by steel. Its colour is like that of nickel or iron. When exposed to the air it soon tarnishes and assumes a yellow colour. Uranium forms several oxides, which are used in painting on porcelain, yielding a fine orange colour in the enamelling fire, and a black colour in that in which the porcelain itself is baked Uran-mica (ŭ'ran-mi-ka), n. In astron. one of the primary

planets, discovered by Sir William Herschel in 1781. It was first called Georgium Sidus in honour of George III., afterwards called Herschel, in honour of the discoverer. It is the seventh planet in order of distance from the sun. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1754 millions of miles, and the length of the year 30686 82 days, or about 84 of our years. Its mean diameter is esti-84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 124 times more. The length of its day is supposed to be between 9 and 10 hours. There is still some uncertainty as to the number of satellites belonging to the length of the same Herschel records in the contract of the same Herschel records in the same than the sa ing to Uranus. Herschel records six, and two of the four which are seen by astronomers at the present time cannot be identified with any of these. Utilitarian (û-til'i-tă"ri-an), a. [From utility.] Consisting in or pertaining to utility: pertaining to utility: pertaining to utilitarian.

Ity; pertaining to utilitarianism. See extract.

It was in the winter of 1822-23 that I formed the plan of a little society, to be composed of young men agreeing in fundamental principles—acknowledging Utility as their standard in ethics and politics, and a certain number of the principal corollaries drawn from it in the philosophy (Benthamism) I had accepted—and meeting once a fortnight to read essays and discuss questions conformably to the premises thus agreed on. The fact would hardly be worth mentioning, but for the circumstance that the name I gave to the society I had planned was the *Chilitarian* collecty. It was the first time that any one had taken the title of *ntilitarian*; and the term made its way into the language from this humble source. I did not invent the word, but found it in one of Galt's Novels, The Junals of the Parish, in which the Scotch clergyman, of whom the book is a supposed autobiography, is represented as warning his parishioners such to leave the gospel and become a banner I seized on the word, and for some years called myself and others by it as a sectarian appeliation; and it came to be occasionally used by some others holding the opinions which it was intended to designate.

Utilitarian (ū-til'i-tă"ri-an), n. One who holds the doctrine of utilitarianism.

The utilitarians are for merging all the particular virtues into one, and would substitute in their place the greatest usefulness, as the alone principle to which every question respecting the morality of actions should be referred.

\mathbf{V}

V, the twenty-second letter of the English alphabet, representing a labial or labio-dental consonant sound, produced by the junction of the upper teeth with the lower junction of the upper teeth with the lower lip, as in pronouncing av. ev. ov. vain. Its sound (which never varies) is accompanied by the same position of the organs as that required for f. but v is uttered with voice, and is therefore called sonant, while f is surd, or uttered with breath merely. Both v and f are also continuous consonants, their sound being not checked at once (as in the case of p, t. &c.), and they also belong to the class of the spirants. As mentioned under U, v and u were formerly the same letter, but they have now as distinct uses as any two letters in the alphabet. The Roman letter v consonant was probably Roman letter v consonant was probably pronounced as a w: thus ver, spring, would be pronounced wer; vespa. a wash anawa pronounced as a v: thus ver, spring, would be pronounced ver; vespa, a wasp, wespa. This letter did not belong to the Anglo-Saxon alphabet, and its sound is believed to have been represented by f, but appears to have occurred only between two vowels (as in heefon, heaven). At the beginning of words fregularly kept its own sound, and this explains how at the present day scarcely any of the English words that begin with v are Teutonic (nat nave and wizer are excep-Teutonic (vat, vane, and vixen are exceptions), though v is common enough in the body of words, as in have, leave, live, heaven, &c. Almost all English words with initial v, therefore, are of Romance origin, the letter having entered our alphabet from the French. The giving of the v sound to f also illustrates the change of consonant in the plural of such words as thief, thieves, wolf, wolves, life, lives. In the dialect of Southern England v commonly takes the place of f. England v commonly takes the place of f. In spelling this letter is never final (though its sound often is), nor is it ever doubled. See also U.—As a numeral, V stands for 5.—In music, V. S. stands for volta subito, turn over (the leaf) quickly.—In her. V. is used to express ver or green, in the tricking or drawing of arms with a pen and ink.

mitigating its attack.

Vaccination (vak-si-nā'shon), n. The act of vaccinating; the art or practice of inoculating persons with the cow-pox, either directly or indirectly, for the purpose of securing them from the contagion of small-pox. The indirect method of vaccination by lymph taken from a pustule caused by previous vac-cination in a healthy child is the most com-mon. Dr. Jenner was the first who showed the beneficial effects of vaccination, which, in a great proportion of instances, confers a complete security against small-pox. Even in those cases where the small-pox does occur after vaccination it is generally divested of its more formidable characters. Repeated vaccinations, with intervals of several years, are believed to increase the security. In England the vaccination of all children, excepting those in an unlealthy or otherwise unft condition, is compulsory within three months after birth: in Scotland the time extends to six months. The state (vak'u-mz), or sometimes Vacua (vak'u-mz), result, nempty space, a void or vacuity, neut. sing. of vacuus, empty; akin vacant, vacation, &c.) Space empty, or space devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epi-

cureans, and Atomists; but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' The modern theory, which seems to be warranted by experience, is that an absolute vacuum cannot exist, the subtle medium known as ether being believed to be everywhere present. In a less strict sense a vacuum (more or less perfect) is said to be produced when air is more or less completely produced when air is more or less completely removed from an inclosed space, such as the receiver of an air-pump, a portion of a barometric tube, &c. In the receiver of the air-pump the vacuum can only be partial, as the exhaustion is limited by the remaining air not having sufficient elasticity to raise the valves. The Torricellian vacuum, that is, the space above the mercury in a carefully manipulated barometer tube, is more nearly perfect in this respect, but the space is to periest in this respect, but the space is to some extent filled with the vapour of mer-cury. If, however, an air-pump receiver, filled with pure carbonic acid gas (so as to expel the air), be exhausted, a small vessel containing moist caustic potash, and another containing concentrated sulphuric acid, havcontaining concentrates suppure acid, naving been previously introduced, the remaining carbonic acid is taken up and a vacuum produced so nearly absolute that the electric spark fails to pass through it.

An instrument for indicating difference between the external atmospheric pressure and the pressure inside a partially exhausted vessel, such as a steam-boiler which has become cold and in which the steam has condensed, the pressure of the pressure the receiver of an air-pump, &c. E. H. Knight.

Vacuum-pan (vak'ū-um-pan), n. for boiling saccharine juices in a partial vacuum during the process of sugar-making. It is usually spheroidal in shape, and is made in two segmental or semi-globular portions. The vapour from the boiling juice rises into the dome at the top, when it is removed by a pump or condenser. The advantages of this vessel over the old pans are that the quality and quantity of the crystal-lizable sugar are raised, a smaller proportion of grape-sugar or molasses being produced. E. H. Knight.

Vapour (vá'por), n. [L. vapor, steam, vapour; from same root as vapidus, vapid, having lost flavour, vappa, wine that has become vapid; comp. Goth. afhvapnan, to be suffocated.]

1. In physics, a term applied to designate the gaseous form which a solld or liquid substance assumes when heated. Vapour is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liqueflable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapour, such as steam. In common language, however, a difference is usually recognized: a gas is a substance which at ordinary temperatures and pressures exists in a state of vapour; while a vapour is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of vapour, while superheated steam is said to be a gas. Aqueous vapour formed on the surface of the land and water h. Fr. ton: ng. sing: TH. then; th. thin;

is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See EVAPORATION.

2. In a more general and popular sense, any visible diffused substance floating in the atmosphere and impairing its transparency, as fog or mist; hazy matter.

From the damp earth impervious vapours rise, Increase the darkness and involve the skies. Pope

A bitter day that early sank Behind a purple frosty bank Of vapour, leaving night forlorn. Something unsubstantial, fleeting, or tran-sitory; mental fume; vain imagination; un-real fancy.

2. The extent to which a thing varies; the degree, interval, or amount of departure from a former condition or position; amount or rate of change.—3. In gram. change of termination of words, as in declension, conjugation, comparison, and the like; inflection. Watts.—4. The act of deviating; deviation; as, a variation of a transcript from the original.—5. In astron. any deviation from the mean orbit or mean motion of a heavenly body, occasioned by another disturbing body. When these deviations are compensated in comparatively short periods of time they are called periodic variations, but when the compensation requires an immense period of time for its consummation the variation is called a secular variation.—Variation of the moon, an inequality in the moon's rate of from a former condition or position; amount

motion, occasioned by the attraction of the sun, and depending as to its degree on the moon's position in her orbit.—6. In physics and navigation, the deviation of the magnetic needle, or needle of the mariner's compass, from the true north point; or the angle which the needle makes with the plane of the meridian of a ship or station; called also Declination. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian until it arrives at its maximum towards the east, when it returns as before. In the year 1576, in London, the variation was 11° 15′ east; in 1652, the needle pointed due north, after which time it travelled about 24½ to the westward (the maximum being in 1815); it is now considerably less and is continually decreasing. The variation, however, is very different in different parts of the globe, and it sales subject to diurnal changes in the same place.—7. In music, one of a series of ornamental changes or embellishments in the treatment of a tune, movement, or theme during several successive repetitions. The simplest kind of variation is by introducing into the melody a greater or less number of passing notes (that is, notes intermediate in into the melody a greater or less number of passing notes (that is, notes intermediate in pitch between the original notes of the air), pitch between the original notes of the air, together with cadenzas, scale movements, and the like, or by breaking of the chords into triplets, quadruplets, &c., or throwing them into arpeggio form, the fundamental harmony usually remaining unchanged. In more chaborate styles, however, new harmonies, rhythms, and melodic developments gradually appear, often brilliantly displaying the fertility of the composer's fancy. In many cases variations are mere unmeaning ornaments designed to exhibit the mechanical dexterity of the performer. Calculus of cal desterity of the performer.—Calculus of variations, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on variate with oral maximum of minding of certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetrical.—

Specifically, in scientific classifications, a subdivision of a species of animals or plants; an individual or group of individuals differing from the rest of the species to which it belongs in some accidental circumstraces which are not assential to them. stances which are not essential to the species. Varieties are considered as less permanent than species, and those naturalists who look upon species as strictly distinct in their origin, consider varieties as modifi-cations of them arising from particular causes, as climate, nourishment, cultivation, and the like. See the following quotation.

and the like. See the following quotation.

No one definition fof species) has satisfied all naturalists; yet every naturalist knows vaguely what he means when he speaks of a species. The term variety is almost equally difficult to define; but here community of descent is almost universally implied, though it can rarely be proved. Practically when a naturalist can unite by means of intermediate links any two forms, he treats the one as a variety of the other, ranking the most common, but sometimes the one first described, as the species, and the other as the variety. But cases of great difficulty sometimes arise in deciding whether or not to rank one form as a variety of another even when they are closely connected by intermediate links. Few well-marked and well-known varieties can be named which have not been ranked as species by at least some competent judges.

In like manner the term variety is applied to inorganic substances of the same kind, which are susceptible of classification, to note differences in colour, structure, crystallization, and the like, all the varieties being referable to some one species which is assumed as the typically perfect standard; as, varieties of quartz, diamond, and the like.

revealed by Brahma, and on which the Brahmanical system is based. The hymns, which are upwards of 1000, fall into four divisions (Vedas or Sanhitas), called respectively Rig-Veda, Yajur-Veda, Sama-Veda, and Atharva-Veda, of which the first (see RIG-VEDA) is the oldest and the Atharva-Veda the latest. Each of these Vedas or Sanhitas consists of two parts—the Sanhita proper, or a collectwo puris—the Sannia proper, or a collection of Mantras or hymns, consisting of invocations, adoration, thanksgiving, praise, prayer, and the like, and of Brahmanas, or commentaries, which have grown round the Sanhita, consisting of explanations, mystical and philosophical gravulations in leganders. and philosophical speculations, legends and illustrations, injunctions in regard to rites and sacrifices, and the like. Varying greatly in age, the Vedas represent many stages of thought and worship, the earliest being the simplest, and the later following and reflecting the development of the Brahmanical sys-tem with all its superstitions and rites. Even the most ancient Vedas exhibit a people in an advanced state of civilization. The in an advanced state of civilization. The Vedas had their origin in the wonder with which early man regarded the universe and the operations going on in it. They consist, therefore, largely of highly figurative addresses to the great powers of nature under seemingly individual names, as Indra (the Firmament), Agni (Fire), Mitra (Sunrise), Varuna (the Sea), and the like, behind whom, however, a great Being (Om) is dimly recognized. Gradually these powers became more and more endowed with personality, and ultimately came to be regarded as real di-

Vehmgerichte (fam'ge-richt-te), n. pl. [Pl. of G. vehmgericht—O.G. vehme, feme, feme, punishment, and gericht, a court of justice.] A system of secret tribunals which originated during the middle ages in Westphalia, and during the middle ages in Westphalia, and then spread over Germany when the regular administration of justice had fallen into complete disorder. The chief of the association (the Freignaf = free count) was usually a man of exalted rank, and had the supreme direction of the courts. His associates (Freischöfen = free justices) concurred in an executed the sentences of the court, being bound by a tremendous oath to obey all its behests, and keep secret its proceedings from all that is between heaven and earth. The assemblies of the tribunal were some-times held in public and in the open air, times held in public and in the open air, but were generally held by night in a forest or in some other concealed place. Any person supposed to be guilty of heresy, sorcery, rape, thett, robbery, or murder, might be summoned before the court and compelled to answer the charge brought against him by the accuser, who was one of the Freischöffen. If the accused was found guilty of a capital crime, or if he repeatedly refused to appear on being duly cited, it was the duty of the Freischöffen to put him to death. This system offered great scope for the spirit

to appear on being duly cited, it was the duty of the Freischöffen to put him to death. This system offered great scope for the spirit of private revenge, malice, and interested motives, and many judicial murders were perpetrated. When the governments of the various states became more effective and society more settled, the regular executive struggled to destroy the power of the vehm gerichte, and ultimately succeeded, the last tribunal being held at Zell in 1568.

[Fr. veine, from L. vena, a blood-vessel, vein, also natural bent, genius, supposed to be from same root as veho, to carry. See VEIL.] 1. One of a system of membranous canals or tubes distributed throughout the bodies of animals for the purpose of returning the impure blood from the extremities, surfaces, and viscera to the the extremities, surfaces, and viscera to the heart and lungs. They are devoid of elasticity, and have no pulsation, the motion of the blood being mainly secured by pressure of the moving muscles, between which they are imbedded, the backward flow of the blood being prevented where necessary by a series of valves which permit a current only towards the heart. The veins arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries. These venous capillaries unite to form ultimate veins, which still unite in turn, forming gradually larger branches and trunks as they approach the centre of the circulation. The approach the centre of the circulation. The venous blood returned from above the region of the heart is united in one great vein, the vena cava superior, all those from below entering by the vena cava inferior. The portal vein (vena porta) receives the venous blood from the intestines and conveys it through the liver to the vena cava inferior. The pulmaneur vein and hear available of the vena cava inferior. veys it through the liver to the vena cava inferior. The pulmonary vein and branches go from the right side of the heart to the lungs, carrying the blood to the air-sacs to be revivified by the oxygen of the inspired air. The veins like the arteries are composed of three coats. Valves are absent in the vene porte, the portal, the pulmonary, and various other veins and or present; and various other veins, and are present in greatest numbers in the veins of the extremittes. -2. A tube or an assemblage of tubes through which the sap of plants is transmitted along the leaves. The term is more appropriately applied to the finer and more complex ramifications which interbranch with each other like net-work, the larger and more direct assemblages of vessels being called *ribs* and *nerves*. Veins are also found called ribs and nerves. Veins are also found in the calyx and corolla of flowers.—3. A crack or fissure in a rock, filled up by substances different from the rock, and which may either be metallic or non-metallic. Veins are some-times many yards wide, having a length of many miles, and they ramify or branch out many miles, and they ramity or branch out into innumerable smaller parts, often as slender as threads. Metallic veins are chiefly found in the primary, and lower and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in veins.—4. A streak or wave of different colour, appearing in wood, in marble, and other stones; a long irregular streak of colother stones; a long irregular streak of col-our.—5. It is not applied to the movements of animals, or but rarely. See CELERITY.— 2. In physics, rate of motion, whether fast or slow; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The velocity of a body is uniform when it passes through equal spaces in equal times, and it is variable when the spaces passed through in equal times are unequal. The velocity of a body is accelerated when it passes or a flody is accelerated when it plasses through a greater space in equal successive portions of time, as is the case of falling bodies under the action of gravity, and it is retarded when a less space is passed through in each successive portion of time. When the motion of a body is uniform its velocity is measured by the space described by it in a unit of time as one second. If the moa unit of time as one second. In the mo-tion of the body is not uniform its velocity is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure velocity, may be assumed of any magnitude, but in theoretical mechanics one second is usually taken as the unit of time, and one foot as the unit of space.—Angular velocity. [L. venalis, venal, for sale, from venus or venum, sale; akin to Skr. vasna, a price.] Rendy to be sold for money or other consideration and entirely from soror consideration and entirely from soft-did motives; basely or meanly disposed of or to be disposed of for lucre; mercenary; hireling; as, a venal politician; venal ser-vices. 'And shakes corruption on her venal throne.' Thomson.

Venal and licentious scribblers, with just sufficient talents to clothe the thoughts of a pandar in the style of a bellman, were now the favourite writers of the sovereign and the public.

Macaulay.

Venal. Mercenary, Hireling. Although both venal and mercenary are used in a bad sense, venal is much stronger than mercenary standing to it in the relation of sale to hire. A venal man sells himself wholly to bis numberer secrificing character, honto his purchaser, sacrificing character, hon-our, principle, his whole individuality in-deed for gain; a mercenary man acts with a view to profit in what he does, and is actuated by sordid motives, but he does not necessarily surrender himself unreservedly, or even make any sacrifice of principle, With the mercenary man love of gain is the with the mercenary man love of gain is the chief motive; with the venal man it is in effect the only motive. Hirching denotes that hire is the motive, and thus implies something servile as well as mercenary, conveying more of contempt than of reprooation.

Thus needy wits a vile revenue made,
And verse became a mercenary trade.

Dryden.

spirit, promised to the Church, was not a vain thing, or a mere verb.

2. In gram, that part of speech whose essential function is to predicate or assert something in regard to something else (the subject or thing spoken of); as, the boy runs, the man lift the stone, fishes swim, he suffers much. Verbs have the power of indicating time and mode by means of tenses and moods, but this is not an essential property. They have been divided into active and neuter verbs, according as they predicate action or state. Active verbs are divided into intransitive and transitive, according as the action is confined to the actor or passes from him to an object. Intransitive verbs often take an objective of their own nature; as, he runs a race; he sleeps the seleps the suffix to the church, the verb in the former use is said to be causative. Many causative verbs are distinguished from their corresponding intransitives by a change Many causative verbs are distinguished from their corresponding intransitives by a change of form, as it, set; lie, lay; fall, fell. Some verbs are sometimes transitive, sometimes intransitive, and sometimes neuter; as, he foats a scheme; John can foat now; the corpse foats. A small class of verbs, as is, become, exist, wax, and grow (in such phrases as, my hair becomes white; he waxes weak; he grows old), predicating only existence or transition from one state to another, are called substantive verbs, and this name is sometimes restricted to the verb to be. Passive verbs affirm suffering or endurance of what another does. Hence, only verbs which take an object after them can have a passive voice, because it can be said of obwhich take an object after them can have a passive voice, because it can be said of objects only that they suffer or endure the action directed on or towards them by the subject of the active verb. Passive verbs are thus the correlatives or complements of active verbs. The infinitive mood, gerund, and supine are properly verbal nouns, implying action or state only without the power of assertion. Participles are adjectives plus the notion of time and cannot therefore the notion of time, and cannot therefore

as some leaves, when the inventor, Peter Vernier (vérs., n. [From the inventor, Peter Vernier, of Brussels, who died 1637.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which or a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and it is divided into a number of equal parts either greater by 1 or less by 1 than the number that it by 1 or less by 1 than the number that it covers on the primary scale. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale ab is divided into inches and tenths of inches; the small movable scale cd is the vernier, and consists of a length of eleven parts of ab, divided into ten parts, each part being therefore equal to one and one-tenth of the divisions upon

to one and one-tenth of the divisions upon a b, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure the zero of the vernier is set to the division 80 inches, the division 10 upon the vernier corresponding with that of 28 inches 9 tenths on the scale. Hence, the vernier division 1 is non-hundredth of a sign 1 is non-hundredth of a scale.

of 28 inches 9 tenths on the scale. Hence, the vernier division 1 is one-hundredth of an inch below the scale division 2 on the vernier is two-hundredths below 29 inches 8 tenths, and so on. Supposing the vernier were raised any number of hundredths, as two hundredths of an inch, the division 2 would coincide with 29 inches 8 tenths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale must be taken for the hundredth required. The vernier now usually employed has one graduation more than the corresponding portion of the scale. The principle in both cases is, however, the same.

Vibration (vi-bra'shon), n. [L. vibratio, vibrationis, from vibro. See VIBRATE.] 1. The act of vibrating; oscillation.—2. In physics, the oscillating or reciprocating motion made by a body, as a pendulum, a musical chord, or elastic plate, when disturbed from the position or figure of equilibrium, to recover that position or form again. When the reciprocating movement is comparatively slow, as that of the pendulum, which is produced by the action of gravity on the whole mass of the body, the term oscillation is generally confined to a motion with rapid reciprocations, as that of a sonorous body, and which proceeds from the reciprocal action of the molecules of the body on each other when a disturbance takes place in their state of equilibrium. The term vibration is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse, by which means waves or undulations are caused. The laws of vibratory motion form the foundation of the theories devised by modern science to account for the phenomena of acoustics and theories devised by modern science to ac-count for the phenomena of acoustics and count for the phenomena of acoustics and optics. by base services. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services. Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of pure villenage, but where the service, although of a base nature, was certain and defined, it was called privileged villenage, and sometimes villein socage. It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or villeins became entitled, by prescription or custom to hold their lands against the lord so long as they performed the required services. And although the villeins themselves acquired freedom, or their land came into the And although the villeins themselves acquired freedom, or their land came into the possession of freemen, the villein services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to show for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called tenants by copy of court-roll, and their tenure a copy-hold.

Stillingfeet.—Virtual focus, in optics, the point from which rays which have been rendered divergent by reflection or refraction appear to issue.—Virtual velocity, in mech. the velocity which a body in equilibrium would actually acquire during the first instant of its motion, in case of the equilibrium being disturbed. The principle of virtual velocities may be thus enunciated: 'If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an infinitely small space, which space will represent the virtual velocity of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in 2. Being in essence or effect, not in fact forces, and as negative those described in the opposite direction.' This great prin-

ciple is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently it applies immediately and most evidently to all questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle the power multiplied by the space through which it moves in the vertical direction must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

Brahma and Siva, forms the trimurit, or trinity; the Preserver, considered by his worshippers to be the supreme god of the Hindu pantheon. In the early Vedas he appears as the manifestation of the sun, and was not regarded as the most exalted deity, this rank being accorded to him by the later writers of the Rāmāyana, the Mahābhārata, and more especially of the Purānas. The Brahmanic myths relating to Vishnu are characterized by the idea that, whenever a great physical or moral disorder affected the world, Vishnu descended in a small portion of his essence to set it right. Such descents are called avattras or avatars, and consist in Vishnu's assuming the

form of some wonderful animal or super-human being, or as being born in human form of human parents, and always endowed with miraculous power. These avatars are

generally given as ten, nine of which are already past, the tenth, the Kalkitenth, the Kalki-avatara, being yet to come, when the practices taught by the Vedes and the institutes of the law shall have ceased, and the close of the Kali or present age shall be nigh. Vishnu is sometimes represented as riding on Garuda, a being half bird and half man; as hold-ing in one of his four hands a conch-shell blown in battle, in another a disc, an emblem of supreme nower; in the 'nird

See HORIZON. — Visible speech, a term applied by Prof. A. Melville Bell, its inventor, to a system of alphabetical characters designed to represent every possible articulate utter-ance of the organs of speech. The system is based on an exhaustive classification of ance of the organs of speech. The system is based on an exhaustive classification of the possible actions of the speech organs, each organ and every mode of action having its appropriate symbol. It is said that this invention is of great utility in the teaching of the deaf and dumb to speak, and in enabling learners of foreign languages to acquire their propunciation from books enabling learners of roreign languages to acquire their pronunciation from books.— SYN. Like linnets in the pauses of the wind. Tennyson. Voice as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of men and other animals: contradistinguished from speech or articulate language. Voice is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal chords (see under Voozl), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. Voice can, therefore, only be found in animals in which the system of respiration is developed, and the fore, only be found in animals in which the system of respiration is developed, and the lungs and larynx actually exist. Fishes having no lungs are dumb. In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the notes of the voice have nearly all the same pitch, and the variety of the sounds is due rather to articulation in the mouth than to definite movements of the glottis and vocal chords. In singing the successive sounds have vibra-In singing the successive sounds have vibra-tions corresponding in relative proportions to the notes of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and con-tratio. The lowest female note is an octave traito. The lowest female note is an octave or so higher than the lowest note of the male voice; and the female's highest note is about an octave above that of the male. The compass of both voices taken together is about four octaves, the chief differences residing in the pitch and also in the timbre. 2. The faculty of speaking; as, to lose one's voice.—3. A sound produced by an inanimate object and regarded as representing the voice of an intelligent being; sound emitted; as, the voice of the winds. 'The trumpet's voice.' A dison. Addison.

Volcano (vol-kā'nô), n. pl. Volcanoes (volkā'nôz). [It. volcano, vulcano, Fr. vulcan,
from L. Vulcanus, the god of fire; cog.
Skr. ulkā, fire] A hill or mountain more
or less perfectly cone-shaped, with a circular cup-like opening or basin (called a
crater) at its summit: popularly termed a
burning mountain. In the centre of the
crater is the mouth of a perpendicular shaft,
which sends out clouds of hot vapour, gase,
and, at times of increased activity, showers
of ashes, hot fragments of rocks, and streams
of fiery liquid rocks, called lava, which flow of flery liquid rocks, called lava, which flow down the slopes of the mountain. The gra-dual accumulation of these ejected materials

Section of an active Volcano

around the crater forms a succession of concentric layers which explains the conical shape. The mountain has often several subsidiary cones connected with the principal, and lava may flow out from various mouths or vents. The flames described as issuing from the crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scoriæ, and ashes. Nearly all active volcanoes have times of relative repose, interrupted, often at great intervals, by periods of increased activity, which terminate in a violent ejection of incandescent matter from the interior. The volcano is then said to be in a state of eruption, which is usually foreboded by loud subterranean noises, like explosions of distant artillery, shocks of earthquake, &c. The most important European volcanoes are Vesuvius, near Naples, whose sudden eruption in 79 A. D. overwhelmed Pompeli, Herculaneum, and other cities; Etna, in the island of Sicily; and Hecla in Iceland.

A volcano has been described by Sir Charles Lyell as 'a more or less perfectly conical hill or mountain formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication with the interior of the earth, by which the ejections are effected.

purpose.

'Will'is an ambiguous word, being sometimes put for the 'faculty' of willing; sometimes for the 'act' of that faculty, besides other meanings. But volition always signifies the 'act of willing,' and nothing else. Willingness, I think, is opposed to unwillingness or aversion. A man is willing to do what he has no aversion to do, or what he has some desire to do, though perhaps he has not the opportunity; and I think this is never called volition.

Reid.

With volumed smoke that slowly grew To one white sky of sulphurous hue. The distant torrent's rushing sound
Tells where the volumed cataract doth roll.

Byron.

Volumenometer (vol'ū-men-om'e-ter), n.

[L. volumen, a volume, and Gr. metron, a measure.] An instrument for measuring the volume of a solid body by the quantity of a liquid or of air which it displaces, and thence liquid or of air which it displaces, and thence also for determining its specific gravity. A very simple volumenometer consists of a globular flask with a narrow neck, about 12 inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper, for admitting the solid body to be measured. The instrument being filled to the mark 0° on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. The stopper is then replaced, and the number of divisions through which the liquid is raised in the stem gives at once the volume of the bodying rain-measures. Watts' Dict. of Chem.

Volumenometry (vol'ū-men-om'et-ri), n. The art of determining the volumes or space occupied by bodies: applied generally, however selvit or cells believe terestater.

occupied by bodies: applied generally, how-ever, only to solid bodies; stereometry.

Volumetric (vol-ū-metrik), a. In chem. of or pertaining to, or performed by measured volumes of standard solutions of reagents. — Volumetric analysis, titration (which see).

Volumetrically (vol-u-met/rik-al-li), adv.
By volumetric analysis.

Voluminous (vô-lūmin-us), a. [Fr. volumineux. See Volume.] 1. Consisting of many coils or complications.

Woman to the waist and fair
But ended foul in many a scaly fold
Voluminous and vast.
Milton.

2. Of great volume or bulk; large; extensive;

bulky, though I seem of a prodigious waist, Why, though 1 seem of a product I am not so voluminous and vast But there are lines wherewith 1 might be embraced.

B. Fonson.

8. Having written much; producing books that are bulky or writing many of them; hence, copious; diffuse.

The most severe reader makes allowances for many rests and nodding places in a voluminous writer.

He did not bear contradiction without much passion, and was too voluminous in discourse.

A person who of his own free accord offers the state his services in a military capacity without the stipulation of a substantial reward. The oldest volunteer company in Britain is the Honourable Artillery Company of London, whose charter dates from the reign of Henry VIII. In 1794, and again in 1808, when the ambition and threats of France agitated England, the government reckoned upon having a force of half a million efficient volunteers in arms; but by 1815 this force almost ceased to exist. About 1867 a feeling of insecurity began to but by 1810 this force almost ceased to exist.

About 1857 a feeling of insecurity began to
manifest itself in consequence of the alleged
insufficiency of the national defences, and
several volunteer corps were formed. In
the course of two or three years many thousands of volunteer rifemen were enrolled
throughout the kingdom. Corps of artillerymen, engineers, &c., were subsequently formed. These bodies of men the British government provides with competent instructors, arms, and a part of their ammunition, besides allowing to each corps certain grants calculated on the number of the efficient members, &c. A volunteer can resign on giving a fortnight's previous notice, unless when the country is reasonably considered in imminent danger.

Vortex (vor'teks, n. pl. Vortices (vor'ti-sēz) or Vortexes (vor'tek-sez). [L., from verto, anciently vorto, to turn. See VERSE.] 1. The form produced when any portion of a fluid is set rotating round an axis; a whirling or gyratory motion of any fluid whether liquid or aeriform. Familiar examples are seen in eddies, whirlpools, waterspouts, whirlwinds, and on a larger scale in cyclones and storms generally. It is more particularly applied to a whirlpool or a body of water moving with a circular motion, and forming a cavity in the centre, into which all bodies coming within its influence are drawn and engulied. 'Roll in her vortex and her power confess.' Pope. 'The huge vortex of Norse darkness.' Carifle.—2. In the Cartesian philos a collection of material particles, forming a fluid or of material particles, forming a fluid or ether, endowed with a rapid rotatory motion about an axis, and filling all space, and by which Descartes accounted for the and by which Descartes accounted for the motions of the universe. This theory attracted much attention at one time, but is now entirely discredited.—Vortex ring, in physics, a vortical molecular flament or column returning into itself so as to form a ring composed of a number of small rotating circles placed side by side, like beads on a string, as the singular smokerings which are sometimes produced when a cannon is fired, or when a smoker skilfully emits a puff of tobacco smoke. Recent labours in the theoretical investigation of the motion of vortices, more particularly the theorems relating to vortex filaments rotating round a central axis in a frictionless or perfect fluid, have suggested the posless or perfect fluid, have suggested the pos-sibility of founding on them a new form of the atomic theory.

dead carcasses and offal. Their geographical distribution is confined chiefly to warm countries, where they act as scavengers to purify the earth from the putrid carcasses with which it would otherwise be encum-

bered. The Vulturids are divided into several genera, the chief being Vultur, Cathartes, Sarcorhamphus, Neophron, and Gypastos, of which the last approaches to the Falconide in its characters and habits, having the head feathered and not always feeding the head feathered and not always feeding on carrion, but often attacking living animals. The griffon vulture (V. fulvue) inhabits the mountainous parts of the south of Europe, Silesia, Spain, the Alps, the Pyrenees, Turkey, and the Grecian Archipelago. The cinereous or brown vulture (V. cinereus) inhabits lotty mountains in Europe, and the forests of Hungary, the Tyrol, and the Pyrenees, the south of Spain and Italy. The hearded vulture, or Immunerever (Gunattos Pyrenees, the south of Spain and Italy. The bearded vulture, or lämmergeyer (Gypaëtos barbatus), inhabits the highest mountains of Europe, Asia, and Africa. The Egyptian vulture is the Neophron perconopterus. The sociable vulture (V. auricularis) is a gigantic species, inhabiting the greater part of Africa. The black vulture (Cathartes atratus) is a native of the United States. The king vulture (Sarcorhamphus papa) is common in Paraguay. Sarcorhamphus gryphus is the condor of South America. In some recent systems the vultures of the Old World are grouped into one family, Gypaetide, while systems the vintures of the Old world are grouped into one family, Gypaetide, while those of the New World form another, Ca-thartide, the two families being marked by various distinctive peculiarities.

\mathbf{W}

W is the twenty-third letter of the English w is the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. Gee V and U.) The name, double u, however, being given to the letter from its form or composition, and not from its sound, is not a very suitable one. In the Anglo-Saxon alphabet it had a character with a distinction of the control of the con appaset it had a character with a distinc-tive form of its own, the more modern letter being adopted in the thirteenth century. This letter is used to represent two sounds, the one which distinctively belongs to it being that which it has at the beginning of a syllable and followed by a vowel, as in wave, will, dwell, away, forward, &c. This sound has somewhat the character of a vowel, and w in such a position is hence often vowel, and win such a position is hence often spoken of as a semi-rowel. It is formed by opening the mouth with a close circular configuration of the lips, the organs having exactly the position they have in pronouncing the oo of foot. Yet it has not really a vowel sound in such cases, and well, for instance, is not equivalent to oo-cil. This fact is more conclusively shown by such work. is more conclusively shown by such words as wood, wood, woman, in which the co-sound is distinctly preceded by a consonant. Its true character is also shown by the definiis distinctly preceded by a consolant. Its true character is also shown by the definitions given by the best modern phonologists for a consonant and a vowel. Thus, Mr. Melville Bell defines a vowel as the result of an open position of the oral organs; an articulation (or consonant) as the result of an opening action of the organs. It is this opening action that marks w as distinct from oo, yet pronounced in a drawling manner it is hardly different in force. At the end of syllables, in which position it is always preceded by a vowel, it has either no force at all (or at most lengthens the vowel), as in law, lawful, to sow, low, hollow, &c., or it forms the second element in a diphthong, as in now, row, new, few, being then really a vowel, and equivalent to the u in neutral, bough, &c. Followed by r it is initial in a considerable number of English words, as wrap, write, wrong, &c. It is lish words, as wrap, write, wrong, &c. It is now silent in such positions, though it was long sounded, as it still is in Scotland. Wh long sounded, as it still is in Scotland. Wh is another initial combination, as in what, where, whale, whet, &c. In Anglo-Saxon these words were spelt with hw (which in cognate words represents Icel. hv, L. qu' initial), there being a guttural sound originally heard before the w. In Scotland, in such words as what, whale, a very decided guttural is heard before w. With the best speakers of modern English however who seems to be weather the such seems to be weather the seems to be weather the seems to be whether the seems to be weather the seems t before w. With the best speakers of modern English, however, wh seems to be w with a slight aspiration after it, though there is a tendency to pronounce w pure and simple. In Anglo-Saxon wi was also an initial sound; thus lisp was originally wlisp, the w having

disappeared. It has also disappeared from tree, knee, four, ooze, such, sister, &c.; and, as above mentioned, it is not heard in many as above mentioned, it is not heard in many words, to which may be added such as sword, two, answer, gunwale, &c. In many words it has taken the place of an older g, as in law, maw, &c. (See G.) It has intruded itself into whole, whore. A w coming before a often has the effect of giving the latter an o-sound (comp. wad, wallow, water, &c.); qu(=kw) has the same effect.—As an abbreviation W stands for west; W.N.W. for west-northwest; W.S.W. for west-south-west, &c. Waget (wâ'jer), n. 10 Fr. wageure, gageure, from L. L. wadiatura. See WAGE, vt. '1. Something deposited, laid, or hazarded on the event of a contest or some unsettled question; something staked by each of two parties in support of his own opinion concerning a future or an unknown event; a stake. The party whose opinion proves to be correct receives what has been staked by both. By statutes of England, Scotland, and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and the wager or money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honour, and if paid it is in the eye of the law the same thing as giving a gratuity.

Pertaining to wagers; betting. — Wagering policy, or wager policy, a policy of insurance insuring a sum of money when no property is at hazard, as a policy to insure money on a ship when no property is on board. Such policies are generally held to be null and void. Wages (wa'jez), n. pl. [O. Fr. wage, gage, a pledge, security. Wages are what the person hiring another has pledged himself to give. See WAGE.] The payment given for services performed, the price paid for labour; the return made or compensation paid to those employed to perform any kind of labour or service by their employers; hire; pay; meed; recompense. Though a plural, wages sometimes has a verb in the singular.

The wages of sin is death. Rom. vi. 23.

The wages of sin is death. Rom. vi. 23.
Thou thy worldly task hast done,
Home art gone, and ta'en thy wages. Shak.
Wages, then, depend mainly upon the demand and supply of labour.

J. S. Mill.

Note. In ordinary language the term wages is usually restricted to the remuneration for mechanical or muscular labour, especially to mechanical or muscular labour, especially to that which is ordinarily paid at short intervals, as weekly or fortnightly, to workmen. Correctly speaking, however, what is called the fees of professional men, as lawyers, physicians, &c., the solaries of public functionaries, business men, &c., the pay of military and naval men, and the like, are all wages. On the other hand, when an author publishes a book, or a shoemaker sells a pair of shoes, the sums received are not wages, though to the seller they are virtually the same thing. Waget, † n. Wagon, Waggon (wag'on), n. [A. Sax. weegen, weegn, ween, which in later times became wain; D. and G. wagen, Icel. and Sw. vagn, Dan. vogn; lit. a carriage, what carries, from root seen in A. Sax. wegan, Icel. vega, to carry; cog. Skr. vah, L. veho, to carry (whence vehicle). Akin also to way, weigh, &c. Skeat remarks that wagon cannot come directly from the A. Sax., wain being the word that has directly descended from it (with same change of form as in rain, hail, nail, &c.). He therefore regards wagon as borrowed from the Dutch in the fifteenth or sixteenth century. Yet it seems fifteenth or sixteenth century. Yet it seems strange that with wain in common usage ifteenth or sixteenth century. Yet it seems strange that with wain in common usage we should have borrowed another word of the same signification.] 1. A four-wheeled vehicle for the transport of heavy loads. The English wagon is usually a strong heavy machine drawn by two horses yoked abreast. The fore wheels are much smaller than the hind pair, and their axle is swivelled to the body of the wagon to facilitate turning. The bodies of most wagons are set on springs on account of the weight of the vehicle and the absence of the steadying power of the horse, who expends his force in pulling only, the weight being distributed over the four wheels. Common varieties of the wagon are the brewer's dray, the railway lorry, and the agricultural wain. Wagons, such as are used by carriers, are frequently provided with wooden bows, over which a covering of heavy canvas or the like may be stretched to protect their contents from rain. The ends of the bows are inserted in staples on each side of the vehicle, so that tilt and bows can be readily removed when not required. In the United States wagons of a much lighter build, and drawn by one horse only, are much used for the conveyance of passengers and light and drawn by one horse only, are much used for the conveyance of passengers and light commodities.—2. The following explanation of the phrase appeared in the Saturday Review. 'Years ago there was a person named Walker, an aquiline nosed Jew, who exhibited an orrery, which he called by the erudite name of Eidouranion. He was also a popular lecturer on astronomy, and often invited his pupils, telescope in hand, to take erudite name of Eidouranion. He was also a popular lecturer on astronomy, and often invited his pupils, telescope in hand, to take a sight at the moon and stars. The lecturer's phrase struck the schoolboy auditory, who frequently 'took a sight' with that gesture of outstretched arm and adjustment to nose and eye which was the first garnish of the popular saying. The next step was to assume phrase and gesture as the outward and visible mode of knowingness in general.' Other explanations have been offered equally problematical. roblematical

Mar (war), n. [O.E. werre, wyrre, were, later warre, O.D. werre. O.Fr. werre (Mod. Fr. guerre), the French being from O.H.G. werra, strife, war, werran, to disturb, to

trouble; akin to Mod. G. wirren, to embroil, confuse; D. war, entanglement, confusion, warren, to disturb, to embroil. Supposed to be connected with worse, through the sense of entanglement or confusion.] I. A contest between nations or states (international war), or between parties in the same state (civil war), carried on by force of arms, usually arising, in the first case, from disputes about territorial possessions and frontiers, unjust dealings with the subjects of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest, rarely nowadays from the whim of a despot; in the second case, from the claims of rival contenders for supreme power in the state or for the establishment of some important point connected with civil or religious litherty. In all cases the aim of each contending party is establishment of some important point connected with civil or religious liherty. In all cases the aim of each contending party is to overthrow or weaken the enemy by the defeat or dispersion of his army or navy, the occupation of important parts of his country, such as the capital or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. International or public war is always understood to be authorized by the monarch or sovereign power of the nations; when it is carried into the territories of a hitherto friendly power it is called an aggressive or ofensive war, and when carried on to resist such aggression it is called defensive. Previous to the outbreak of hostilities between states, the power taking the initiatory step issues a declaration of war, which now usually takes the form of an explanatory manifesto addressed to neutral governments. During the progress of the struggle certain laws, usages, or rights of war have come to be generally recognized; such laws permitting the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. Shak.

4. A person or number of persons whose duty it is to watch over the persons, property, or interests of others; a watchman or body of watchmen; a sentinel; a sentry; guard.

Such, they say, as stand in narrow lanes,
And beat our watch, and rob our passengers. Shak.
The towers of heaven are filled
With armed watch, that render all access
Millon.

5. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary. The night, when the precautionary setting of a watch is most generally necessary. The Jews, like the Greeks and Romans, divided the night into nillitary watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P.M.), the second or 'middle watch' (10 P.M. to 2 A.M.), and the third, or 'morning watch' (from 2 A.M. till sunrise). After the establishment of the Roman power they were increased to four, which were named according to their numerical order, as first, second, &c., or by the terms even, midnight, second, &c., or by the terms even, midnight, and 6 A.M. See Ex. xiv. 24; Judg. viii. 19; Lam. ii. 19; and Mat. xiv. 25; Mark xiii. 35. 6. Naut. (a) the period of time cacupied by each part of a ship's crew alternately while on duty. The period of time called a vatch is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 P.M., the time is divided into two short or dogwatches in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 P.M. is called the afternoon watch, from 4 to 8 the first dog.watch, from 6 to 8 the second dog.watch, from 8 to 12 noon the forencom vatch. When this alternation of watches is kept up during the 24 hours, it is termed having watch and watch, in distinction from keeping all hands at work during oneor more watches. Anchor watch a small watch composed of one or two men appointed to look after the ship while st watch is most generally necessary. The Jews, like the Greeks and Romans, divided

anchor or in port. (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two portions: the starboard watch, which in the merchant service coara watch, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the portreatch, which in the merchant service is commanded by the chief mate. In the royal navy these watches are commanded by the lieutenants successively.—7. Anything by which the progress of time is perceived and measured; as, (a)t a candle marked out into sections, each of which was a certain time in burning. in burning.

Fetch me a bowl of wine. Give me a watch. Shak. (b) A small time-piece, now universally circular in shape, to be carried in the pocket or about the person. The essential parts of a watch are the dial on which the hours, minutes, and seconds are marked, the hands which move round the dial pointing to these divisions, the train of wheels which carry round the hands, &c., the balance which regulates the motion of the wheels, and the regulates the motion of the wheels, and the coiled spring (the mainspring), whose elastic force produces the motion of the whole machinery, the movement being inclosed in a protecting case usually of gold or silver.—

A repeating watch or repeater has in addition a small bell, gong, or other sounding object on which the hours, half-hours, quarters the case struck on the supported and ters, &c., are struck on the compression of a spring. A chronometer watch or pocket chronometer is one of the finest kinds of watches fitted with a compensation balance and other devices which prevent the variaand other devices which prevent the varia-tions of temperature from affecting the regu-lar movement of the watch. (See CHRON-OMETER.) Watches were invented at Nürem-berg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune.

I frown the while; and perchance wind up my watch, or play with my—some rich jewel. Shak.

I frown the while; and perchance wind up my watch, or play with my-some rich jewel. Shak.

8. In pottery, a trial piece of clay so placed in a kiln that it can be readily withdrawn to enable the workmen to judge by its appearance of the heat of the fire, and the condition of the ware remaining in the saggers.—The Black Watch, a name originally given to certain armed companies, wearing a fark tartan, raised in Scotland about 1668 to keep the Highlanders in order. In 1789 they were formed into a regular regiment, the 42nd, long famous as the Black Watch. Latterly this and the 73rd regiment have been combined to form the first and second battalions of the Black Watch, otherwise the Royal Highlanders.—Watch and ward, the ancient custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between watch and vard, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to keep watch and ward, here indicated in the protecting of the protecting by day. cially in the phrase to keep watch and ward, they implied a continuous and uninter-rupted watching and guarding, constant vigilance and protection by night and by

Water (wa'ter), n. [O.E. watere, weter, weater, A. Sax. wester; O. Sax. watar, D. and L.G. water, G. wasser. The Scandinavian forms are somewhat different: Dan. vand (for vadn), Icel. vatn, Sw. vatten; similarly Goth. vato (pl. vatna). From a root vad, ud, seen also in L. udus, wet, unda, a wave; Gr. hydör, Skr. udan, water. Akin wet. Otter is also from this root, itt. the water animal.] 1. A fluid, the most abundant and most necessary for living beings of any in nature, except air. Water, when pure, is transparent, inodorous, tasteless; a powerful refractor of light, an imperfect conductor of heat and electricity; it is very slightly compressible, its absolute diminution for a pressure of one atmosphere being only about 513 millionths of its bulk. Although water is colourless in small quantities, it is blue like the atmosphere when viewed in mass. It assumes the solid form, of a watch.

that of ice or snow, at 32° F., and all lower temperatures; and it takes the form of vapour or steam at 212° F. under a pressure of 29.9 ins. of mercury, and retains that form at all higher temperatures. Under ordinary conditions water possesses the liquid form only at temperatures lying between 32° and 212°. It is, however, possible to cool water very considerably below 32° F. and yet maintain it in the liquid form; the vessel containing the water must be perfectly clean, and the water must be maintained in a state of perfect rest. Water may also be heated, and the water must be maintained in a state of perfect rest. Water may also be heated, under pressure, many degrees above 212° F. without passing into the state of steam. The specific gravity of water is 1 at 39° 2° F., being the unit to which the specific gravities of all solids and liquids are referred, as a convenient standard, on account of the facility with which it is obtained in a pure state; one cubic inch of water at 62° F., and 29°9 inches, barometrical pressure, weighs 252 '486 grains. Distilled water is 816 times heavier than atmospheric air. Water is at its greatest density at 39°2° F. (=4° C.), and in this respect it presents a singular exception greatest density at 39°2 F. (=4° C.), and in this respect it presents a singular exception to the general law of expansion by heat. If water at 38°2 F. be cooled, it expands as it cools till reduced to 32°, when it soli-difies; and if water at 38°2 F. be heated, it expands as the temperature increases in accordance with the general law. In a chemical point of view water exhibits in itself neither acid nor basic properties; but it combines with both acids and bases forming hadrates; it also combines with but it combines with both acids and bases forming hydrates; it also combines with neutral salts. Water also enters, as a liquid, into a peculiar kind of combination with the greater number of all known substances. Of all liquids water is the most powerful and general solvent, and on this important property its use depends. Without water not only the operations of the chemist but the processes of animal and vegetable life would come to a stand. In consequence of the great solvent power of water it is never found pure in nature. Even in rain-water, which is the purest, there are always traces of carbonic acid, ammonia, and sea-salt. Where the rain-water has filtered through rocks and soils, and reappears as spring or rocks and soils, and reappears as spring or rocks and soils, and reappears as spring or river water, it is always more or less charged with saits derived from the earth, such as sea-sait, gypsum, and chaik. When the proportion of these is small the water is called soft, when larger it is called hard water. The former dissolves soap better, and is therefore preferred for washing; the latter is often pleasanter to drink. The only way to obtain perfectly pure water is to distil it. Distilled water is preserved in clean well stopped bottles, and used in chemical it. Distilled water is preserved in clean well stopped bottles, and used in chemical operations. Water is reposited in the earth in inexhaustible quantities, where it is preserved fresh and cool, and from which it issues in springs, which form streams and rivers. But the great reserving of water of the contract of th issues in springs, which form streams and rivers. But the great reservoirs of water on the globe are the ocean, seas, and lakes, which cover more than three-fifths of its surface, and from which it is raised by evaporation, and, uniting with the air in the state of vapour, is wafted over the earth ready to be precipitated in the form of rain, snow, or hall. Water is a compound substance, consisting of hydrogen and oxygen, in the proportion of 2 volumes of the former gas to 1 volume of the latter; or by weight it is composed of 2 parts of hydrogen united with 16 parts of oxygen. Its formula is H₂O.—2. Water collected in a body; the ocean; a sea; a lake; a river; any collection of water. 'Such as travel by land or by water.' Common Prayer.

She walks the water like a thing of life.

She walks the waters like a thing of life, And seems to dare the elements to strife. Byron On one side lay the Ocean, and on one Lay a great water, and the moon was full.

3. Water from the heavens; rain.

3. Water from the heavens; rain.

By sudden floods and fall of waters,
Buckingham's army is dispersed and scatter'd.

4. Used of other fluids, liquid secretions,
humours, &c.; as, (a) tears. 'Command these
fretting waters from your eyes.' Shak. (b)
Urine; the animal liquor secreted by the kidneys and discharged from the bladder. Shak.

5. The colour or lustre of a diamond or
pearl, sometimes perhaps of other precious
stones; as, a diamond of the first water, that
is, perfectly pure and transparent. Hence
the figurative phrase, a man or a genius of
the first water, that is, of the first excellence.
'Diamonds of a most praised water.' Shak. Diamonds of a most praised water.' Shak.

Water bewitched, a term applied to any

very weak liquid or greatly diluted drink.
'No more than water bewitched. Swift.

Another book . . . is of much more stupid character; nearly meaningless indeed, mere water bewitched.

-Water of crystallization, the water which unites chemically with many salts during the act of crystallizing. It forms an essential part of the crystal, but not of the salt, and is easily expelled by heat, when the crystals generally fall to powder.—Tohold water, to be generally fall to powder.—To hold water, to be able to retain water without leaking; hence, tight; sound; and fig. correct; valid; well-grounded and developed: said of arguments, theories, and the like. 'Inequalities of proceeding will never hold water. Sir R. L'Estrange.—Mineral waters. See under Mineral.—Strong waters, brandy, liquors, &c. [This term, once much in use, is now almost obsolete.]

Water-spout (wa'ter-spout), n. water-spout (water-spout), n. A remark-able meteorological phenomenon frequently observed at sea, and exactly analogous to the whirlwinds experienced on land. It occurs when opposite winds of different temperatures meet in the upper atmosphere, whereby a great amount of vapour is con-densed into thick blook along the state. whereby a great amount of vapour is con-densed into a thick black cloud, to which a vortical motion is given. This vortical mo-tion causes it to take the form of a vast funnel, which, descending near the surface of the sea, draws up the water in its vortex, which joins in its whirling motion. The whole column, which after the junction ex-tends from the sea to the double sessions. tends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides.

Water-spout.

When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea the heavy abover of this Sudden gusts of in a heavy shower of rain. Sudden gusts of wind, from all points of the compass, are very common in the vicinity of water-spouts. What are sometimes called water-spouts on what are sometimes cancel water-spotes on land are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They occur generally during thunder-storms, and differ only from severe hail-storms in point of temperature.

(Scotch.) Wave (wav), n. [O.E. wave, from A. Sax. wave, a wave, a word perhaps allied to the verb to way; Icel. wayr, G. waye, D. wove, a wave; the form of the word in English has been modified by the verb to wave, so the wave the wave way the wave the wave ways to recorded. that vave the noun may be regarded as a kind of hybrid word. See WAVE, v.t.] 1. An undulation, swell, or ridge on the surface of water or other liquid resulting from the oscillatory motion of its component particles, when disturbed from their position of ticles, when disturbed from their position of rest by any force; especially, the rolling swell produced on the surface of the sea or other large body of water by the action of the wind; a billow; a surge. When the surface of a liquid is pressed down at any part, the adjoining parts rise, but sink again by the action of gravity; and acquiring a momentum proportionate to the mass and height, descend below the original level, displacing other parts near them, which rise and sink in a similar manner. The result is a reciprocating motion, the particles to which the primitive impulse was communicated being alternately the lowest and the cated being alternately the lowest and the highest, forming the series of ridges and hollows called waves. Where the depth of the liquid is invariable over its extent, or sufficient to allow the oscillations to proceed unimpeded, no progressive motion takes place, each ridge or column being kept in its place by the pressure of the adjacent columns. Should, however, free oscillation columns. Should, however, free oscillation be prevented, as by the shelving of the shore, the columns in the deep water are not balanced by those in the shallower parts, and they thus acquire a progressive motion towards the latter, or take the form of breakers, hence the waves always roll in a direction towards the shore, no matter from what point the wind may blow. When waves are produced by the disturbance of a small quantity of the liquid as when a relible is quantity of the liquid, as when a pebble is thrown into a pool, they appear to advance from the disturbed point in widening con-centric circles, the height of the wave decentric circles, the height of the wave decreasing gradually as it recedes from the centre; but there is no progressive motion of the liquid itself, as is shown by any body floating on its surface. The whole seems to roll onwards, but, in reality, each particle of water only oscillates with a vertical ascent and descent. The height of the wave depends in a great measure on the depth of the water in which it is produced. The waves of the ocean have been known in some instances to have reached a height of 43 feet, measured from the trough to the creat. The horizontal pressure of a strong Atlantic wave, as tested by Stephenson's marine dynamometer, has been recorded as high as 3 tons to the square been recorded as high as 3 tons to the square foot. It is a matter of common observation that a wave of much greater dimension than others occurs at certain intervals, rolling much higher on the shore than those im-

mediately preceding or following it, or breaking with immense force over the decks of vessels on the open sea. This is caused when several coexisting series of waves moving with different velocities meet, and the crests of two or three of them become superimposed upon each other. Several series of waves moving in different direc-tions may also coexist without destroying tions may also coexist without destroying each other, giving rise to the chopping seas or cross swells so troublesome to mariners. The length of a wave is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A wave is points of two audining nonlows. A wave is said to have passed through its length when its elevated part has arrived at the place where the elevated part of the next wave stood before; or, the situation of two contiguous waves being given, when one of these terminals of the other residuals to the place of the other residuals. has arrived at the place of the other; and the time which is employed in this transi-tion is called the time of a wave's motion or the time of an undulation. The velocity of the time of an undulation. The velocity of a wave is the rate at which the points of greatest elevation or depression seem to change their places. — Pidat wave. See TIDE-WAYE.—2. In physics, a vibration propagated from one set of particles of an elastic medium to the adjoining set, and so on; sometimes, but not always, accompanied with a small permanent displacement of such particles. The theory of the motion of waves is of great importance in physical science; since, not only is it connected with science; since, not only is it connected with the phenomena of the waves of the ocean ordinarily produced by the wind, the tidal wave, &c., it has also a close relation to the phenomena of undulating nusical strings, the undulations in solids, as in earthquake waves &c. while we know that sounds in waves, &c., while we know that sounds in air are propagated as waves, and that even light is now generally held to be a form of wave-motion. See SOUND, LIGHT, UNDULATORY.—3. Water. [Poetical.]

the remarkable structure of their nests, which are woven in a very wonderful man-ner of various vegetable substances. Some species build their nests separate and singly, and hang them from slender branches of trees and shrubs, but others build in com-panies, numerous nests suspended from the panies, numerous nests suspended from the branches of a tree being under one roof, though each one forms a separate compartment and has a separate entrance. They are natives of the warmer parts of Asis, of Africa, and of Australia, none being found in Europe or America. The Ploceus icterocephalus, or yellow-crowned weaver, is a native of South Africa, and constructs an isolated pensile kidney-shaped nest, about 7 inches long by 4½ broad, with an opening in the side. Naturalists are not quite agreed

as to whether the nests of the weaver-bird as to whether the nexts of the weaver-hird are built in their own peculiar manner as a means of preservation against the rain, or against the attacks of serpents and small quadrupeds, probably the latter.

wedge (we), n. [A. Sax. wegd, a garment. See WeBD.] Clothing: apparel. Chaucer.
Wedge (we), n. [A. Sax. wegge, a mass, a wedge; loel. vegr. Dan. vegge, Sw. vigg, D. weg, O.G. wecke, wedge, possibly from the same root as wag, way, weigh, and signifying lit. the mover.] 1. A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular and three rectangular surand three rectangular surand three rectangular where

The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raining immens weights as when a

ducing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back, D.C. to the length of the side, D.F., on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, of for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration DFO. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to off for the instant the resistance on its sides. angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied.—2. Weight (wāt), n. [0.E. weght, wight, A. Sar. ge-with, from wegan. See WEIGH.] 1. That property of bodies by which they tend toward the centre of the earth; gravity; as, a body has weight or has no appreciable weight.—2. The measure of the force of gravity, as determined for any particular body; the measure of the force by which any body or a given portion of any substance gravitates or is attracted to the earth; in a more popular sense, the amount which anything weighs; the quantity of matter as estimated by the balance or expressed numerically with reference to some standard unit; as, a bar of metal having a weight of bles; a load of 8 tons weight. In determining weight in cases where very great Weigh-shaft (wa'shaft),n. In steam-engines, 5 lbs.; a load of 8 tons weight. In determining weight in cases where very great precision is desired, due account must be taken of temperature, elevation, and latitude. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it; therefore, as the density of the air is variable—air when warmed expanding very much more than any solid—a piece of metal appears to weigh more in warm than in cold weather. Moreover air becomes more dense by an increase of pressure, consequently by an increase of pressure, consequently when the barometer is high all heavy bodies become apparently lighter; when the baro-

meter is low they become apparently heavier. Now suppose a pound of iron and a pound of platinum are adjusted in light air and again compared in dense air, a slight change may be observed. For as a pound of iron is bulkier than a pound of platinum it displaces more air, and its apparent weight undergoes a greater change than does that of platinum. Hence in fixing exact standof platinum. Hence in fixing exact stand-ards of weight a particular temperature and ards of weight a particular temperature and pressure of air must be specified; thus the standard brass pound of Britain is directed to be used when the Fahrenheit thermometer stands at 62° and the barometer at 30°. In the second place it must be observed that the attraction which the earth exerts upon bodies placed near it decreases with their distances from its centre, being inversely as the squares of the distances; thus a body weighing a pound at the level of the sea will weigh somewhat less when tested properly at the top of a mountain. In the third place, since the earth has a diurnal motion on its axis, every substance placed on it has a centrifugal tendency which in some degree modifies what otherwise would have degree modifies what otherwise would have been its gravitation; this centrifugal ten-dency produces the earth's oblateness, and causes a variation in the intensity of gravidency produces the earth's oblateness, and causes a variation in the intensity of gravitation from one latitude to another, a stone being heavier at lat. 60° N. for instance than at the equator.— Standard of weight, the unit of mass legally recognized in a state, and by which the weight of other bodies may be determined, and all other weights used in commerce adjusted. In Britain a certain brass weight is by statute settled as the imperial standard troy pound. Sax. hwelan, to roar, to bellow, from the noise they make in blowing.] The common name given to the larger mammals of the order Cetacea. They are characterized by naving fin-like anterior extremities, the pos-terior extremities having their place sup-plied by a large horizontal caudal fin or tail, and the cervical hones so compressed as to leave the animal without any outward ap-pearance of a neck. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance that not only the vulgar but even some of the having fin-like anterior extremities, the posnot only the vulgar, but even some of earlier zoologists regarded them as belong-ing to that class. The whales are usually ing to that class. The whales are usually divided into two families, the Baismidee and the Physeteridee or Catodontidee. The Baismidee, or whalebone whales, are distinguished by the absence of teeth, by the presence of baleen or whalebone, and by the nostrils being placed on the top of the head. The typical representative of this family is the common or Greenland whale Raleman. the common or Greenland whale (Balema mysticetus), so valuable on account of the oil and whalebone which it furnishes. It is principally found in the Arctic seas, but it is

But it was simply called the white, the white colour of its grain seeming to distinguish it best from those plants with white the white colour of its grain seeming to distinguish it beat from those plants with which otherwise it had the greatest similarity. For this is one of the secrets of nonmatopoesis—that it should express, not the most important or specific quality, but that which strikes our fancy. Max Müller.] A plant of the genus Triticum, and the seed of the plant, which furnishes a white flour for bread and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Of cultivated wheats there are many varieties, the differences, however, being mostly due to soil, climate, and mode of cultivation. Three primary varieties may be mentioned: (a) T. hybernum (muticum), winter or unbearded wheat; (b) T. sestieum (aristatun), summer or bearded wheat; (c) T. Spelta (admerens), spelt or German wheat, which is of much less value than the others, but grows on poorer soils and more elevated localities. White wheat and red wheat are names applied according to the colour of the grain, the red sorts being generally hardier than the plied according to the colour of the grain, the red sorts being generally hardier than the white, but of inferior quality, and the yield is less. Winter wheat is sown in the autumn, with the view of being harvested the following year; summer wheat is sown in the spring of the year is which it is reason. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery or circular ring. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. They receive different names according to their forms and uses; as, balancewheel, cog-wheel, crown-wheel, dash-wheel, eccentric, fly-wheel, friction-wheel, lantern-wheel, paddle-wheel, pinton, pin-wheel, planterwheel, ratchet-wheel, scape-wheel, spur-wheel, trachet-wheel, turbine, &c., which are described at more or less length according to their importance under these headings.—

2. Any instrument, apparatus, machine, or other object having a wheel-like shape, or 2. Any instrument, apparatus, machine, or other object having a wheel-like shape, or the essential feature of which is a wheel; as, (a) a machine for spinning yarn or thread. See Spinning-wheel.

Thus, in lower life, whilst the wheel the needle, &c., employ her, the plough or some trade perhaps demands the muscles and hardiness of him.

(b) The revolving disc used by the potter in modelling. See Potters' Wheel under Por-

Then I went down to the potter's house, and, behold, he wrought a work on the wheels. Jer. xviii. 3. (c) A circular frame with handles projecting from the periphery, and an axle on which are wound the ropes or chains which con-nect with the rudder for steering a ship; a steering-wheel.

I see the sailor at the wheel.

(d) An instrument of torture generally used for criminals of the most atrocious class, formerly employed in France and Germany. In some places it consisted of a carriage-wheel on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round the executioner broke the wretch's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to the sufferings of his victim by two or three severe blows, called coups de grace (mercy strokes), on the chest or stomach, or by strangling him. In Germany its use lingered down till the beginning of the nineteenth century.

4.† The burthen of a song; the refrain.

You must sing, down a-down, an you call him a-

down-a.

O, how the wheel becomes it.

-Wheel and axle, one of the mechanical

powers, consisting in its primary form of a cylindrical axle on which a wheel, concertic with the axle, is firmly fastened. By reference to figs. 1, 2, it will be seen that this power resolves itself into a lever of the

first order, in which the weight and power are at the ends, and the fulcrum between them. C is the centre or fulcrum; A C and CB are the semi-diameters of the wheel and the axie; and on the principle of the lever the power is to the weight as AC is to CB. The wheel is grooved and carries a coll of rope; another rope is secured to the axis; and when the power is in motion, every revolution of the wheel raises the weight to volution of the wheel raises the weight to a height equal to the circumference of the axis or cylinder. In a great many cases a crank takes the place of the wheel, and the circumference described by the handle is substituted for the circumference of the wheel. The power is increased by enlarging the wheel or lengthening the arm of the crank, or by diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel safety. There is a modification of the wheel and axle, called the double axis machine or differential windlass, in which the power can be increased with more safety. This is

shown in fig. 3, where b and c are two cylinders of different diameters, n firmly fixed on the axis carrying the crank a. The rope is coiled round the smaller cylinder, carried through a pulley supporting the

supporting the weight, and then at-tached to the large cylinder in a contrary direction. When in motion every turn of the crank lifts the weight to a height equal to half the difference between the cirequal to half the difference between the cir-cumferences of the two axes; and the power is therefore to the weight as this half differ-ence is to the circumference of the power, or the circle described by the craft α . Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if α and α come to be of equal thickness, the b and c come to be of equal thickness, the weight would not rise at all, the rope, in weight would not rise at all, the rope, in that case, wound upon b being only equal to that unwound from c. (See under DIFFERENTIAL.) The wheel and axle is sometimes called the perpetual lever, in consequence of the power being continued by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill are so many applications of the wheel and axle. —Wheels within wheels, a complication of circumstances, motives, influences, or the like.

It was notorious that after this secretary retired the king's affairs went backwards; wheels within wheels took place. Roger North.

-To break upon the wheel, to subject to the — To break upon the wheel, to subject to the punishment described under 2 (d) above. — To break a fly (butterfly, &c.) upon the wheel, (a) to subject to a punishment out of all proportion to the gravity of the offence and importance of the offender.

[If the historical account below is correct, the origin would seem to be the Sc. word whig, to jog along briskly, the connections of this being doubtful.] 1. A designation given to the members of one of the connections or time being doubtful, I. A designation given to the members of one of the great political parties in Britain. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Burnet it is derived from whiggam, a word which was used by the present of the south. which was used by the peasants of the south-west of Scotland in driving their horses. He tells us that people from this quarter used often to come to Leith with their horses used often to come to Leith with their horses for corn, and from this peculiar word were called whiggamores, contracted to whigs. In 1648, after the news of the Duke of Hamilton's defeat, the clergy of the west of Scotland stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishioners. The Marquis of Argyle and his party came and headed them. This was called the whiggamores' inroad, and ever after that all that opposed the court came, in contempt, to be called whiggs. From Scotland the word was brought to England, where it has since continued to be used as the distinword was brought to England, where it has since continued to be used as the distinguishing appellation of the political party opposed to the Tories. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of England. Generally speaking, the principles of the Whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. The term Liberals is now generally applied to the representatives of this party; while the extreme section of the party may be said to have dropped all connection with the Whigs, and have adopted the name of said to have dropped all connection with the Whigs, and have adopted the name of Radicals. Whip (whip), v.t. pret. & pp. whipped; ppr.
whipping. [Originally applied to various
kinds of quick motion or action, and allied
to D. wippen, to hasten, to skip, to toss;
wip, a lift, a swing, a swipe; O.D. wippe, a
whilp; I.G. wippen, Dan. vippe, to see-saw;
G. wippen, to rock, to see-saw, &c. The h
would seem, therefore, not to belong properly to the word. The meaning of flog
comes from the noun, and the noun has
probably got it from the resemblance of a
whip to a swipe. Perhaps more than one
word may be mixed up under this form;
comp. W. chwip, a quick turn; chwipiaw, to
move briskly.] 1. To take or seize with a

—Whispering gallery or dome, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other. foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. The reason is that the sounds produced in one of the foci of such a chamber strike upon the wall all round, and, from the nature of the ellipse, are all reflected to the other focus. This serves in some measure to explain the effects of whispering galleries and domes in general.

Whist (whist), n. A well-known game at cards, said to be so called because the parties playing it have to be whist or silent, but this is doubtful. Another name was whisk. The game is played with the full pack of fifty-two cards by four persons, two being partners against the other two, each player receiving thirteen cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honours, and count one each for the side who holds them; if one side hold three honours, they count two by honours, as the opposite side can to one side hold three honours, they count two by honours, as the opposite side can have but one; if one side hold all the honours, four by honours is counted; should the honours be equally divided neither side counts, the honours being then said to can-cel each other. In long whist, an obsoles-cent form of the game, ten of these points made a game. In short whist, the game now

generally played, the number has been reduced to five, and in this form it is common to count by tricks alone. A rubber consists of a series of three games, and is won by the side that secures two of them. Should one party gain two games in succession, the third of the rubber is not played.

Whistle (whist), v.i. pret. & pp. whistled; ppr. whistle, in. (As a. huistlian, to whistle, to plue; Dan. huisle, to hiss, to whistle; to hissel, to whistle; Icel. hviela, to whisper. —Who, Which, That. These agree in being relatives, who being used for persons, which for things, and that being used indifferently for either. Who and which have well-defined different uses: (a) they connect two co-ordinate sentences: as, I met a policeman who showed me the way; I studied geometry which I found useful. Each of these sentences could be turned into two propositions gramcould be turned into two propositions gram-matically, as well as logically, independent: I met a policeman and he showed me the way: I studied geometry and it I found useful. Another use of the same nature is when the second clause is of the kind termed adverbial, where we may still resolve who and which into a personal or demonstrative and which into a personal or demonstrative pronoun and a conjunction; as, why should we condemn James who (for he, seeing that he) is innocent? why should we study phrenology which (seeing that it) is profitless?

Now, in these latter uses, who and which cannot be turned into and he, and it. The following sentence, standing alone, is ambiguous: 'I re-read the book which gave me much pleasure.' This may mean either that the re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate sentences and belongs to section (a), or it may mean I re-read the book which when formerly read gave me much pleasure. In the latter case the second clause limits or explains the object of the first and belongs to section (b). To remove such ambiguity, and the unpleasant effect arising from the too frequent use of who and which, it has been proposed by some grammarians (es. the universal of who and which, it has been proposed by some grammarians (especially Professor Bain) always to employ that and not who or which, when the relative is used to introduce a restrictive or adjectival clause, and instead of saying 'the man who hath no music in himself . . . is fit for treasons, &c., 'they are the books . . . which nourish all the world, to say, as Shakspere says, 'the man that hath, &c.,' reserving who and which for such cases as are noticed under section (a). Will (wil), n. [A. Sax. willa, will, from willan, to desire; D. wil, Icel. vili, Dan. villie, Sw. and Goth. vilja, O.H.G. willo, willio. See the verb.] 1. That faculty or power of the mind by which we determine either to do or not to do something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue; the power of producing acts of willing; the power of control which the mind possesses over its own operations.

Appetite is the will's solicitor, and the will is appetite's controller; what we covet according to the one, by the other we often reject.

Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of will.

Reid.

2. The act of willing; the act of determining choice or forming a purpose; volition.

choice or forming a purpose; volition.

It is necessary to form a distinct notion of what is meant by the word 'volition' in order to understand the import of the word 'will,' for this last word expresses the power of mind of which volition is the cat. The word 'will,' however, is not always used in this its proper signification, but is frequently substituted for 'volition,' as when I say that my hand moves in obedience to my will.

D. Stewart.

3. The determination or choice of one possessing authority; discretionary pleasure; behest; command; decree.

Thy will be done. Mat. vi. ro. Go then, the guilty at thy will chastise. 4. Strong wish or inclination; bent of mind; disposition.

He that complies against his will, Is of the same opinion still. Hudibras.

WIT.I.

Inclination is another word with which will is frequently confounded. Thus, when the apothecary says in Romes and Fuiliti:

My powerty and not my will consents, &c. the word will is plainly used as synonymous with inclination, not in the strict logical sense, as the immediate antecedent of action. It is with the same latitude that the word is used in common conversation, when we speak of doing a thing which duty prescribes, against one's own will; or when we speak of doing a thing willingly or unwillingly.

5. That which is atrongly wished or desired.

5. That which is strongly wished or desired.

7. In law, the legal declaration of a man's intentions as to what he wills to be performed after his death in relation to his property; a testament. In England no will, whether a testament. In England no will, whether of real or personal estate, is to be valid unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction. Such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator. Soldiers on actual service, or mariners at sea, have the power of making nuncupative wills. In the United States the law is in substantial agreement with that of England. In Scotland formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's liferent in the subject was reserved, but heritable tion or deed in which the testator's liferent in the subject was reserved, but heritable property can now be so disposed of.—Good will, (a) favour; kindness. (b) Right intention. Phill i. 15.—Ill will, enmity; unfriendliness. It expresses less than natice. See GOOD-WILL and ILL-WILL.—To have one's will, to obtain what is desired.—To work one's will, to act absolutely according to one's own will, wish, pleasure, or fancy; to do entirely what one pleases with something.

For though the Great Accs beave the bill

—At will, at pleasure. To hold an estate at the will of another is to enjoy the possession at his pleasure, and be liable to be ousted at any time by the lessor or proprietor. See under ESTATE.—With a will, with willingness and pleasure; with all one's heart; heartily.

He threw himself into the business with a will.

Thus, in the first person, I (we) will, the word denotes willimpuess concent intention or proin the first person, I (we) will, the word denotes willingness, consent, intention, or promise; and when emphasized it indicates determination or fixed purpose; as, I will go, if you please: I will go at all hazards: I will have it in spite of him. In the second and third persons will expresses only a simple future or certainty, the idea of volition, purpose, or wish being lost; thus, 'you will go,' or 'he will go,' indicates a future event only. The second person may also be used as a polite command; as, you will be sure to do as I have told you.—As regards will in questions Mr. B. Grant White lays down the following rules: 'Will is never to be used as a question with the first person; as, will I go? A man cannot ask if he wills to do anything that he must know and only he go? A man cannot ask if he wills to do anything that he must know and only he knows. . . As a question, will in the second person asks the intention of the person adversed; as, will you go to-morrow? that is, Do you mean to go to-morrow? . . As a question, will in the third person asks what is to be the future action of the person poken of with a percessary reference to is to be the future action of the person spoken of, with a necessary reference to intention; as, will be go? that is, Is he going? Does he mean to go and is his going sure? Simple futurity with the first person is appropriately expressed by shall. (See SHALL.) Among inaccurate speakers and writers, especially in Scotland, Ireland,

WHELK

and in some parts of the United States, there is some confusion in the use of shall and will; thus will improperly takes the place of shall in such frequently used phrases as, 'I will be obliged to you,' 'we will be at a loss,' 'I will be much gratified,' and so on.—Would stands in the same relation to will that should does to shall. Thus would is seldom or never a preterite indicative pure and simple, being mainly employed in subjunctive, conditional, or optative senses, in the latter case having often the functions and force of an independent verb; as, (a) conditional or subjunctive, 'he would do it if he could;' 'he could do it if he would;' 'they are contained that he are contained. would have gone had they been permitted.' Here it will be seen would refers to the present only, the past being expressed by would have. In such sentences as 'He was mistaken it would seem,' or 'th would spear'—in which should is sometimes used—would retains almost nothing of conditionality, having merely the effect of softening a direct statement. (Mr. R. Grant White regards 'it should seem' as the normal expression, though he quotes 'it would appear' from good English writers. He himself writes, 'It would seem that a man of Mr. Lowe's general intelligence should know,'&c. Everyday English, chap, xiii.) (b) Optative; I would that I were young again.' In this use the personal pronoun is often omitted. 'Would to God we had died in Egypt.' Ex. xvi. 3. 'Would God I had died for thee, O Absalom.' 2 Sam xviii. 3. 'Would thou wert as I am.' Shak.—Would most nearly has the force of a simple past indicative in such sentences as, 'he would go and you see what has happened; 'but this implies farther that he did actually go or at least set out, and the would is here emphatic.—Would is also used to express a habit or custom, as if timplied a habitual exercise of will; as, she would weep all day; every other day he would weep all day; every other day he would will in horses to express motion or change of place, where modern usage would would have gone had they been permitted. Here it will be seen would refers to the pre were formerly often used with adverbs and prepositional phrases to express motion or change of place, where modern usage would require will go, would go, or the like. 'Now I will away,' 'I'll to the ale-house;' 'I will about it;' 'I'll to my books;' he is very sick and would to bed;' 'there were wit in this head, an 'twould out.' Shak.—What may be called a similar elliptical usage occurs in such phrases as 'what would you?' where present usage would supply have or do resent usage would supply have or do.

Wind (wind, in poetry often wind), 4. [A. Sax D. and G. wind, Dan. and Sw. wind, Icel. windr, Goth. winds; cog. L. ventus, W. gwynt, wind. The root is in Goth. vaian, Skr. va, to blow. Weather is from same root.] 1. Air naturally in motion with any degree of velocity; a current of air; a current in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze. rent in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze; when with more velocity, a fresh breeze; and when with violence, a gale, atorm, tempest, or hurricane. The principal cause of those currents of air is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up, while colder air rushes in to supply its place, and thus produces wind. As the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported by these opposite currents is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmotioned, there are various other causes which give rise to currents of air in the atmosphere, such as the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into fixed or constant, as the tradewinds: periodical, as the monsoons; and variable winds, or such as blow at one time from one point, at another from another point, and at another time cease altogether. (See TRADE-WIND, MONSOON.) There are also various local winds, which receive particular names; as, the Etesian wind, the Siroco, the Simoom, the Harmattan, the Mistral. ticular names, as, the stessan tona, the Stroc-co, the Simoom, the Harmattan, the Mistral, Typhoon, &c. (See these terms.) The velo-city and force of the wind vary consider-ably, as shown by the anemometer. Thus a light wind travelling at the rate of 5 miles an hour exercises a pressure of 2 oz. on the square foot; a light breeze of 10 miles an square foot; a light breeze of 10 miles an hour has a pressure of 8 oz.; a good steady breeze of 20 miles, 2 lbs.; a storm of 60 miles, 18 lbs.; a violent hurricane of 100 miles, 50 lbs., a pressure which sweeps everything before it. Winds are denominated from the point of compass from which they blow; as, a north wind, an east wind, a south wind, a rest wind a gouth-west wind, a west wind, a south-west wind, &c.

Except wind stands as it has never stood, It is an ill wind that turns none to good. Tusser.
